Description My company uses a jabber server for iChat. I want to use your product on my Android device. I have the setup matching our login settings for iChat, and then our jabber server gets the following error: error: SSL handshake error (error:140760FC:SSL routines:SSL23_GET_CLIENT_HELLO:unknown protocol) I'm not sure if this is because our server is requiring a specific protocol or what. If it is a server issue, what is necessary to allow for your application to connect to our server? Thanks.			
Related issues: Related to Bug #311: I need force old 5223 ssl support

I think your server use the old SSL method. This method is not supported by Beem however you can check issue [#311](#) which contains a patch to enable it.
